

2D1260 Finite Element Methods

Project Work

September 15, 2010

1 Introduction

The project is divided into three parts: the first part Part A concerns FEM approximation of Poisson's equation and convection-diffusion-reaction equations. The second part Part B concerns duality and local mesh refinements. Some advance applications of the first and second parts are collected in Part C. The purpose of the project is to get familiar with two important partial differential equations, and to gain an understanding of FEM approximation for these equations.

1.1 Puffin - a simple FEM solver

Puffin is a simple FEM solver for Matlab/Octave in the form of (1) two m-files for the assembly of a matrix and a vector (`AssembleMatrix.m` and `AssembleVector.m`), and (2) a file describing the solution algorithm together with the definition of the PDE in variational form, for example `PoissonSolver.m` and `Poisson.m`.

Puffin is part of *FEniCS*, an open source software project for computational technology for solving differential equations. To download and install Puffin from the FEniCS homepage www.fenics.org/puffin:

1. Go to <https://launchpad.net/puffin/+download>.
2. Download Puffin 0.1.6. to your working directory.
3. Unpack the files in `puffin-0.1.6.tar.gz`.

You find the m-files in the `src` directory:

```
$ cd puffin-0.1.6/src
```

Puffin is a minimal implementation of the FEniCS FEM solver *DOLFIN*, which is available for download at www.fenics.org/dolfin. DOLFIN is implemented in C++/Python and is suitable for large scale problems in 2D and 3D.

1.2 Puffin tutorial

A very good way to get familiar with Puffin is to complete the Puffin computer sessions F1-F5 at www.bodysoulmath.org/sessions/.

1.3 Examination

The project can be done individually or in groups of two. Each group should hand in two written reports each including a first page containing: name, email address and educational program for all group members. The deadline for the Report is October 12.

A combined grade E-A will be given for the project, which is part of the final grade of the course:

- For grade A: all problems of Part A and B, one of the four problems of Part C have to be solved.
- For grade B: all problems of Part A and B have to be solved.
- For grade C: all problems of Part A and Problem 1 or 2 of Part B have to be solved.
- For grade D: Problem 1-2.1, 2.2 of Part A have to be solved.
- For grade E: Problem 1-2.1 of Part A have to be solved.

1.4 Report layout

The reports should contain a description of each problem, a plot of the FEM solution of each problem, and (in an appendix) the matlab code used to solve the problem (only the new code written, not the existing Puffin code).

For plotting use `pdesurf` or `pdemesh`, where you can set the view by the command `view`. The standard 3D view is set by:

```
>> view(-37.5,30)
```

For the report use plots by `pdemesh`.

2 Meshes

In Puffin we use the following data structures to represent a finite element mesh:

- **p** - coordinates (x_1, x_2) of the nodes
- **e** - edge information
- **t** - elements (triangles): global node numbers for local nodes 1,2,3. The last number is a subdomain numbering.

For details, see:

www.mathworks.com/access/helpdesk/help/toolbox/pde/ug/index.html?/access/helpdesk/help/toolbox/pde/ug/pdetrg.html

For the project we consider the 2D computational domain $\Omega = [0, 1] \times [0, 1]$, the unit square.

- A uniform triangular mesh \mathcal{T}^1 of the domain Ω is available in Puffin as `square.m`.
- Refining \mathcal{T}^1 uniformly one level we get a new mesh \mathcal{T}^2 which is available in Puffin as `square_refined.m`.

Part A

Consider the convection-diffusion-reaction equation:

$$\dot{u} - \epsilon \Delta u + \beta \cdot \nabla u + \alpha u = f, \quad (x, t) \in \Omega \times (0, T], \quad (1)$$

with $x = (x_1, x_2)$ and $\Omega = [0, 1] \times [0, 1]$, and initial solution $u(x, 0) = u^0(x)$.

Problem 1

Setting $\dot{u} = 0$, $\alpha = 0$, $\epsilon = 1$, $\beta = 0$ gives Poisson's equation with a source term $f(x)$:

$$-\Delta u(x) = f(x), \quad x \in \Omega. \quad (2)$$

We consider homogeneous Dirichlet boundary conditions:

$$u(x) = 0, \quad \forall x \in \partial\Omega. \quad (3)$$

This equation is implemented in Puffin as 2 m-files: `PoissonSolver.m` and `Poisson.m`. To use the solver in Matlab/Octave:

```
>> PoissonSolver
```

Write down a FEM method for this problem using piecewise linear basis functions in space, then solve equation (2) using Puffin for 2 different forces f_1, f_2 , given by:

$$f_1(x) = 32x_1(1 - x_1) + 32x_2(1 - x_2), \quad (4)$$

$$f_2(x) = 10\pi^2 \sin(\pi x_1) \sin(2\pi x_2), \quad (5)$$

corresponding to the two exact solutions u_1, u_2 , given by

$$u_1(x) = 16x_1(1 - x_1)x_2(1 - x_2), \quad (6)$$

$$u_2(x) = 2 \sin(\pi x_1) \sin(2\pi x_2). \quad (7)$$

Plot the solution and the error using the two different meshes \mathcal{T}^1 and \mathcal{T}^2 .

Problem 2

Problem 2.1

Set $\dot{u} = 0$, $\alpha(x) = 0.1$, $\epsilon = 0.01$,

$$\beta(x) = 5(-(x_2 - 0.5), x_1 - 0.5),$$

for the same uniform mesh \mathcal{T}^1 as in Problem 1.

Write down a FEM method for this problem using piecewise linear basis functions in space.

Now compute the stationary solution using the same uniform mesh \mathcal{T}^1 as in Problem 1, with homogeneous Neumann boundary conditions: $\partial u / \partial n = 0$, and with the source term:

$$f(x) = 1, \quad \text{if } |x - (0.75, 0.5)| < 0.1,$$

and $f(x) = 0$ else.

A physical interpretation of this problem is that $u(x)$ is the concentration of a contaminant in the domain Ω with diffusivity ϵ , which experience stirring by $\beta(x)$, and where the contaminant is absorbed at a rate given by the absorption coefficient $\alpha(x)$.

Figure 1: To the left: a hanging node that lies on the edge on a triangle.

Problem 2.2

Write down a FEM method using piecewise linear basis functions in space and implicit Euler time stepping (This is the method used in *F3: Problem 2*). The implicit Euler time discretization for each time interval $I_n = [t_{n-1}, t_n]$, with time step $k_n = t_n - t_{n-1}$, reads: Given $u(t_{n-1})$ find $u(t_n)$ such that

$$\frac{u(t_n) - u(t_{n-1})}{k_n} + \beta \cdot \nabla u(t_n) - \epsilon \Delta u(t_n) = f(t_n) \quad x \in \Omega \subset \mathbb{R}^2.$$

Set $\alpha(x) = 0$, $\epsilon = 0.1$, $\beta(x) = 5(-(x_2 - 0.5), x_1 - 0.5)$, and compute the solution on the mesh \mathcal{T}^2 , up to final time $T = 3.5$, using a time step $k = 0.05$, with homogeneous Neumann boundary conditions: $\partial u / \partial n = 0$, and with the source term:

$$f(x, t) = 1, \quad \text{if } |x - (0.75, 0.5)| < 0.1 \text{ and } |t - \text{round}(t)| < 0.1,$$

and $f(x, t) = 0$ else. This is a time dependent variant of Problem 1. Describe what you see.

Part B

Problem 1

A FEM mesh $\mathcal{T} = \{K\}$ is a sub-division of Ω into a non-overlapping set of *elements* (or *cells*) K , with diameter h_K . To preserve continuity over edges, no node (vertex) of one triangle can lie on the edge of another triangle: such nodes are called *hanging nodes*, see figure below.

When locally refining a FEM mesh it is important to preserve the condition of no hanging nodes. One such algorithm in 2D is the *red-green mesh refinement algorithm*: Mark a number of cells for refinement, then

Figure 2: Illustration of red-green mesh refinement with one cell marked for refinement.

1. loop over all marked cells, for each cell subdivide the edges at the midpoints, which gives 4 new cells, and then
2. loop over all all hanging nodes, and connect each hanging node with the corresponding opposite nodes in each cell.

Implement the red-green mesh refinement algorithm as a Matlab/Octave function in an m-file. Illustrate the algorithm by 3 times refining the mesh \mathcal{T}^1 , marking all cells for refinement with at least one node inside the circle defined by: all $x = (x_1, x_2)$ such that $(x_1 - 0.5)^2 + (x_2 - 0.5)^2 \leq 0.05^2$. Plot the 3 refined meshes.

Problem 2

Solve the dual problem corresponding to Problem 1:

$$-\epsilon \Delta \varphi - \beta \cdot \nabla \varphi + \alpha \varphi = \psi, \quad x \in \Omega, \quad (8)$$

with homogeneous Neumann boundary conditions: $\partial \varphi / \partial n = 0$, and source term

$$\psi(x) = 1, \quad \text{if } |x - (0.25, 0.25)| < 0.1,$$

and $\psi(x) = 0$ else.

Plot the dual solution $\varphi(x)$, and give an interpretation with respect to the error of the FEM solution in Problem 1 in the point $(0.25, 0.25)$.

Part C

Problem 1

Consider the stationary Problem 1, Part A. Compute the residual $R(U)$ of the approximate FEM solution. Refine the mesh using 3 different mesh refinement algorithms:

1. 3 uniform mesh refinements.
2. 5 local mesh refinements where in each step you refine 50% of the elements with largest residual $R(U)$.
3. 5 local mesh refinements where in each step you refine 50% of the elements with largest product $h^2 R(U) \times D^2 \varphi$.

How many nodes are used in the 3 approaches? What are the differences in the refined meshes for approach 2 and 3?

Problem 2

Solve the stationary and time dependent problems (Part A, Problem 2) on \mathcal{T}^1 and \mathcal{T}^2 , now with $\epsilon = 10^{-4}$. What happens with the solutions? Modify the method using least squares stabilization. What changes?

Problem 3

Change the FEM basis in Puffin to using piecewise quadratic basis functions in space. Solve the stationary and the time dependent problems (Part A) with the new basis on \mathcal{T}^1 and \mathcal{T}^2 .

Problem 4

Use Puffin to solve an engineering problem of your choice. Implement the new equation in Puffin, and use a different mesh (not the unit square). To generate a new mesh you may for example use `Triangle`, available for download at:

<http://www.cs.cmu.edu/~quake/triangle.html>

Good luck!

Murtazo Nazarov
