Outline

- 1 Background
 - Resolution
 - Previous Work
- 2 Our Contribution
 - An Idea That Doesn't Work
 - An Idea That Does
 - Pebble Games and Resolution
- 3 Conclusion and Open Problems

Some Terminology

- **Literal** a : variable x or its negation \bar{x}
- **Clause** $C = a_1 \vee \dots \vee a_k$: disjunction of literals
At most k literals: **k -clause**
- **CNF formula** $F = C_1 \wedge \dots \wedge C_m$: conjunction of clauses
 k -CNF formula: CNF formula consisting of k -clauses
(assume k fixed)
- Refer to clauses of CNF formula as **axioms**
(as opposed to derived clauses)

Resolution

- Resolution: proof system for refuting CNF formulas
- Perhaps *the* most studied system in proof complexity
- Also used in many real-world automated theorem provers

Resolution Rule

Resolution rule:

$$\frac{B \vee x \quad C \vee \bar{x}}{B \vee C}$$

Prove F **unsatisfiable** by deriving the unsatisfiable empty clause 0 (the clause with no literals) from F by resolution

Example CNF Formula

1. p
2. q
3. r
4. s
5. $\bar{p} \vee \bar{q} \vee u$
6. $\bar{r} \vee \bar{s} \vee v$
7. $\bar{u} \vee \bar{v} \vee z$
8. \bar{z}

- source vertices true
- truth propagates upwards
- but target vertex is false

Example CNF Formula

1. p
2. q
3. r
4. s
5. $\bar{p} \vee \bar{q} \vee u$
6. $\bar{r} \vee \bar{s} \vee v$
7. $\bar{u} \vee \bar{v} \vee z$
8. \bar{z}

- source vertices true
- truth propagates upwards
- but target vertex is false

Example CNF Formula

1. p
2. q
3. r
4. s
5. $\bar{p} \vee \bar{q} \vee u$
6. $\bar{r} \vee \bar{s} \vee v$
7. $\bar{u} \vee \bar{v} \vee z$
8. \bar{z}

- source vertices true
- **truth propagates upwards**
- but target vertex is false

Example CNF Formula

1. p
2. q
3. r
4. s
5. $\bar{p} \vee \bar{q} \vee u$
6. $\bar{r} \vee \bar{s} \vee v$
7. $\bar{u} \vee \bar{v} \vee z$
8. \bar{z}

- source vertices true
- truth propagates upwards
- **but target vertex is false**

Example Resolution Refutation

1. p
2. q
3. r
4. s
5. $\bar{p} \vee \bar{q} \vee u$
6. $\bar{r} \vee \bar{s} \vee v$
7. $\bar{u} \vee \bar{v} \vee z$
8. \bar{z}

Length, Width and Space

- **Length** $L(\pi)$ of resolution refutation $\pi : F \vdash 0$
distinct clauses on blackboard
- **Width** $W(\pi)$ of resolution refutation $\pi : F \vdash 0$
literals in largest clause on blackboard
- **Space** $Sp(\pi)$ of resolution refutation $\pi : F \vdash 0$
lines used simultaneously on blackboard

Length, Width and Space of Refuting F

- Length of refuting F is

$$L(F \vdash 0) = \min_{\pi: F \vdash 0} \{L(\pi)\}$$

- Width of refuting F is

$$W(F \vdash 0) = \min_{\pi: F \vdash 0} \{W(\pi)\}$$

- Space of refuting F is

$$Sp(F \vdash 0) = \min_{\pi: F \vdash 0} \{Sp(\pi)\}$$

Results for Length and Width

Length

Haken (1985): polynomial-size CNF formula family with exponential lower bound on resolution refutation length (pigeonhole principle)

Width

- $W(F \vdash 0) \leq \# \text{ variables in } F$
- Ben-Sasson & Wigderson (1999): strong correlation between length and width of refuting formula
- Proof search heuristic: search for narrow refutations

Results for Space

- Space introduced by Esteban & Torán (1999)
- Maximal # clauses in memory while verifying proof—related to performance of proof search algorithms
- $Sp(F \vdash 0) \leq \text{size of } F$, or more precisely
 $\leq \min(\# \text{ variables in } F, \# \text{ clauses in } F) + \mathcal{O}(1)$
- Many lower bounds on space proven
- All turned out to match width lower bounds—**true in general?**

Connection between Space and Width

Theorem (Atserias & Dalmau 2003)

For any unsatisfiable k -CNF formula F it holds that

$$Sp(F \vdash 0) \geq W(F \vdash 0) - \mathcal{O}(1).$$

But do space and width always coincide?

Are they in fact the same measure asymptotically?

Or can they be separated?

I.e., is there a k -CNF formula family $\{F_n\}_{n=1}^{\infty}$ such that $Sp(F_n \vdash 0) = \omega(W(F_n \vdash 0))$?

A Separation of Space and Width in Resolution

Our Main Theorem

For all $k \geq 4$, there is a family of k -CNF formulas $\{F_n\}_{n=1}^{\infty}$ of size $\mathcal{O}(n)$ with

- refutation width $W(F_n \vdash 0) = \mathcal{O}(1)$ and
- refutation space $Sp(F_n \vdash 0) = \Theta(\log n)$.

Returning to Our Example Formula

1. p
2. q
3. r
4. s
5. $\bar{p} \vee \bar{q} \vee u$
6. $\bar{r} \vee \bar{s} \vee v$
7. $\bar{u} \vee \bar{v} \vee z$
8. \bar{z}

- Easily generalized to trees of height h
- Refutation width = formula width = $\mathcal{O}(1)$
- Space seems to grow linearly with tree height h ?

2. q
3. r
4. s
5. $\bar{p} \vee \bar{q} \vee u$
6. $\bar{r} \vee \bar{s} \vee v$
7. $\bar{u} \vee \bar{v} \vee z$
8. \bar{z}

z
 \bar{z}

Infer 0 from
 \bar{z} and z

Example Formula Refutable in Constant Space

1. p
2. q
3. r
4. s
5. $\bar{p} \vee \bar{q} \vee u$
6. $\bar{r} \vee \bar{s} \vee v$
7. $\bar{u} \vee \bar{v} \vee z$
8. \bar{z}

 z \bar{z} 0

Infer 0 from
 \bar{z} and z

Expand Formula to Two Variables Per Vertex

Replace **variable** v with **disjunction** $v_1 \vee v_2$:

$$p \quad \Rightarrow \quad p_1 \vee p_2$$

$$\begin{aligned} \bar{p} \vee \bar{q} \vee u &\Rightarrow \bar{p}_1 \vee \bar{q}_1 \vee u_1 \vee u_2 \\ &\quad \bar{p}_1 \vee \bar{q}_2 \vee u_1 \vee u_2 \\ &\quad \bar{p}_2 \vee \bar{q}_1 \vee u_1 \vee u_2 \\ &\quad \bar{p}_2 \vee \bar{q}_2 \vee u_1 \vee u_2 \end{aligned}$$

$$\bar{z} \quad \Rightarrow \quad \begin{aligned} &\bar{z}_1 \\ &\bar{z}_2 \end{aligned}$$

Expanded Formula Yields Separation

- Proof in constant width still works:
Refutation width = $\mathcal{O}(\text{formula width}) = \mathcal{O}(1)$
- But proof in constant space breaks down:
Refutation space = $\Omega(\text{tree height } h)$

Let us have a look at ideas behind proof

Black-White Pebble Game on Directed Acyclic Graphs

Start with all vertices of DAG G empty

- 1 Can **place black pebble** on (empty) vertex v if all immediate predecessors have pebbles on them
- 2 Can always **remove black pebble** from vertex
- 3 Can always **place white pebble** on (empty) vertex
- 4 Can **remove white pebble** from v if all immediate predecessors have pebbles on them

Goal: get **black pebble on target vertex** of G with no other pebbles in G , using as few pebbles as possible

Studied by Cook & Sethi (1976) and many others

Example Pebbling and Pebbling Price

- Cost of pebbling:
max # pebbles simultaneously in G
- Black-white pebbling price $BW\text{-Peb}(G)$ of DAG G :
minimal cost of any pebbling

Example Pebbling and Pebbling Price

- Cost of pebbling:
max # pebbles simultaneously in G
- Black-white pebbling price $BW\text{-Peb}(G)$ of DAG G :
minimal cost of any pebbling

Example Pebbling and Pebbling Price

- Cost of pebbling:
max # pebbles simultaneously in G
- Black-white pebbling price $BW\text{-Peb}(G)$ of DAG G :
minimal cost of any pebbling

Example Pebbling and Pebbling Price

- Cost of pebbling:
max # pebbles simultaneously in G
- Black-white pebbling price $BW\text{-Peb}(G)$ of DAG G :
minimal cost of any pebbling

Example Pebbling and Pebbling Price

- Cost of pebbling:
max # pebbles simultaneously in G
- Black-white pebbling price $BW\text{-Peb}(G)$ of DAG G :
minimal cost of any pebbling

Example Pebbling and Pebbling Price

- Cost of pebbling:
max # pebbles simultaneously in G

- Black-white pebbling price $BW\text{-Peb}(G)$ of DAG G :
minimal cost of any pebbling

Example Pebbling and Pebbling Price

- Cost of pebbling:
max # pebbles simultaneously in G
- **Black-white pebbling price $BW-Peb(G)$** of DAG G :
minimal cost of any pebbling

Pebbling Contradiction

CNF formula encoding pebble game on DAG G with unique target z and all non-source vertices having indegree 2

Associate d variables v_1, \dots, v_d with every vertex $v \in V(G)$

The d th degree pebbling contradiction Peb_G^d over G says that:

- All source vertices have at least one true variable
- For the target z all variables are false
- Truth and falsity propagate according to pebble game rules

Studied by Bonet et al. (1998), Raz & McKenzie (1999), Ben-Sasson & Wigderson (1999) and others

1st Degree Pebbling Contradiction $Peb_{T_2}^1$

Our example formula:

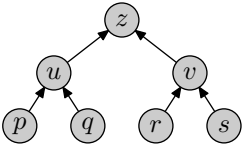

1st degree pebbling contradiction over binary tree of height 2

$$\begin{aligned}
 & p \\
 \wedge & q \\
 \wedge & r \\
 \wedge & s \\
 \wedge & (\bar{p} \vee \bar{q} \vee u) \\
 \wedge & (\bar{r} \vee \bar{s} \vee v) \\
 \wedge & (\bar{u} \vee \bar{v} \vee z) \\
 \wedge & \bar{z}
 \end{aligned}$$

2nd Degree Pebbling Contradiction $Peb_{T_2}^2$

The “expanded formula” is a 2nd degree pebbling contradiction:

$$\begin{array}{l}
 (p_1 \vee p_2) \\
 \wedge (q_1 \vee q_2) \\
 \wedge (r_1 \vee r_2) \\
 \wedge (s_1 \vee s_2) \\
 \wedge (\bar{p}_1 \vee \bar{q}_1 \vee u_1 \vee u_2) \\
 \wedge (\bar{p}_1 \vee \bar{q}_2 \vee u_1 \vee u_2) \\
 \wedge (\bar{p}_2 \vee \bar{q}_1 \vee u_1 \vee u_2) \\
 \wedge (\bar{p}_2 \vee \bar{q}_2 \vee u_1 \vee u_2) \\
 \wedge (\bar{r}_1 \vee \bar{s}_1 \vee v_1 \vee v_2)
 \end{array}
 \wedge
 \begin{array}{l}
 (\bar{r}_1 \vee \bar{s}_2 \vee v_1 \vee v_2) \\
 \wedge (\bar{r}_2 \vee \bar{s}_1 \vee v_1 \vee v_2) \\
 \wedge (\bar{r}_2 \vee \bar{s}_2 \vee v_1 \vee v_2) \\
 \wedge (\bar{u}_1 \vee \bar{v}_1 \vee z_1 \vee z_2) \\
 \wedge (\bar{u}_1 \vee \bar{v}_2 \vee z_1 \vee z_2) \\
 \wedge (\bar{u}_2 \vee \bar{v}_1 \vee z_1 \vee z_2) \\
 \wedge (\bar{u}_2 \vee \bar{v}_2 \vee z_1 \vee z_2) \\
 \wedge \bar{z}_1 \\
 \wedge \bar{z}_2
 \end{array}$$

Making the Connection

Look at resolution refutation of pebbling contradiction $Peb_{T_h}^d$ over binary tree T_h of height h :

- Interpret clauses “on blackboard” in terms of pebbles (our second resolution refutation example of this)
- Show refutation of $Peb_{T_h}^d$ yields black-white pebbling of T_h (but get very ill-behaved pebbling which requires new rules)
- Show many pebbles in graph \Rightarrow many clauses on blackboard (if degree $d \geq 2$)
- Generalizing known bound $BW-Peb(T_h) = \Theta(h)$ to new pebble game gives bound on refutation space $Sp(Peb_{T_h}^d \vdash 0) = \Theta(h) = \Theta(\log(\text{formula size}))$

Conclusion

First lower bound on space in resolution which

- is not the consequence of a lower bound on width
- but instead separates the two measures

Open Problems

Extend to arbitrary DAGs

Our proof **works only for binary trees** (pebbling price collapses for general DAGs because of new rules)

Conjecture 1

For an **arbitrary DAG G** and $d \geq 2$ it holds for the pebbling contradiction Peb_G^d of degree d over G that **$Sp(Peb_G^d \vdash 0) = \Omega(BW-Peb(G))$** .

Would yield almost optimal separation $\Omega(n/\log n)$ between space and width

Best conceivable is $\Omega(n)$

Open Problems (cont.)

Generalize to k -DNF resolution and prove space hierarchy

k -DNF resolution: lines in proof not disjunctive clauses but disjunctions of conjunctions of size $\leq k$

Conjecture 2

For k -DNF resolution refutations of pebbling contradictions defined over complete binary trees T_h of height h , fixing k it holds that $Sp_{\text{Res}(k+1)}(\text{Peb}_{T_h}^{k+1} \vdash 0) = \mathcal{O}(1)$ but

$$Sp_{\text{Res}(k)}(\text{Peb}_{T_h}^{k+1} \vdash 0) = \Omega(h).$$

Would show that k -DNF resolution proof systems for increasing k form strict space hierarchy
