### Overview

#### Lecture 3: Scripts and Functions Wrap Up More on Plotting Scripts and Functions Output, Input and Commenting On Customized Help, Paths and Timing

Yasemin Bekiroglu

Royal Institute of Technology - KTH

### Last time

Wrap Up

- Creating vectors and matrices:
   Ex: linspace, eye, zeros, ones, diag, ...
- Manipulating matrices: Ex: ', triu, tril, flipud, fliplr, rot90,...
- Matrix operations:

Ex:min, max, sum, mean eig, svd, det, rank, trace, sqrtm,...

- Finding elements find
- Plotting:

Ex: plot, xlabel, ylabel, title, get/set (handles)

Yasemin Bekiroglu

### Getting all columns or rows

- To get all rows in a matrix and for example the first column you can use
  - A(:,1)
- Similarly to get all columns for the 3<sup>rd</sup> and 6<sup>th</sup> row you would do A ([3 6], :)

### A word on diag

- The command diag is used to create diagonal matrices
- Can also be used to extract the diagonal of a matrix
- What will diag(diag(A)) do?

Yasemin Bekiroglu

Wrap Up

### Today

- More on plotting (3D)
- Scripts and functions
- More on loading files

Yasemin Bekiroglu

# Creating histograms

Displaying histograms:

hist(v, b)

where  ${\rm v}$  is vector with data and  ${\rm b}$  is number of bins.

If you want the histogram data use:

[n,x] = hist(v,b)

where  $\mathbf{n}$  are frequency counts and  $\mathbf{x}$  are bin locations.

You can plot histogram data with bar(x, n)

Yasemin Bekiroglu

# Loading data

- We saw how you can load saved variables with load <filename>
- You can easily load data directly into MATLAB if the data is matrix-like, i.e. same number of columns for each row
- To load a file "filename.txt" do load ('filename.txt')
- This will put the loaded matrix into a variable filename (the name of the file).
- Can also do

```
d = load('filename.txt');
```

### Exercise 1

- Load data from <u>"gyrosignal.txt"</u> http://www.csc.kth.se/~yaseminb/gyrosignal.txt
- Collected from a gyro while standing still
- Format: Each row contains time and gyrosignal
- The time is in seconds
- The gyrosignal is in rad/s (maybe biased)
- Task:
  - 1. Remove any bias
  - Integrate the signal to verify that the angle is zero at the last time step.

# Modifying the axis

- MATLAB will automatically choose the axis range for you,
- but in some cases this is not what you want.
- Set using: axis([x\_min x\_max y\_min y\_max])
- Get current axis settings with: a = axis;
- Same x/y unit size axis equal
- Square figure with axis square
- Fit to figure axis normal
- You can "turn off" the axis with axis off

# Saving/printing a figure

- You often want to save a figure
- This can be done from the figure menu or with print command.
- To create an eps file, select desired figure and do print -deps <filename> (black/white) print -depsc <filename> (color)
- For print options do help print
- If you want high quality prints for your thesis/publications, check out matlab2tikz

# Getting input from a figure

- You can get information (coordinates) by clicking inside figure
- Use command

```
xy = ginput
(pressing ENTER terminates the command)
or
xy = ginput(n)
```

```
(if you know beforehand how many data points)
```

Yasemin Bekiroglu

### drawnow and pause

- To force a figure to display its content now (flush event queue), use
  - drawnow
- To pause execution and wait for ENTER in command window, use pause
- You can pause for n seconds with pause(n) (e.g. pause(0.1) to pause 0.1s)

Yasemin Bekiroglu

# **Subplots**

- Easy to put many plot in the same figure with subplot (n, m, k)
- Sets up for n by m plots in a figure and prepares to add plot k
- Example

```
subplot(2,1,1), plot(x1,y1)
subplot(2,1,2), plot(x2,y2)
```

Yasemin Bekiroglu

# 3D plots

- Several functions to plot in 3D
- plot3(x,y,z)
- mesh(X,Y,Z)
- surf(X,Y,Z)
- contour(X,Y,Z)
- mesh, surf and contour plot the matrix Z against the values of X and Y.
- You can create values for X and Y with [X,Y] = meshgrid(x,y); where x and y are vectors and X and Y are matrices
- See also colormap

- Display the function  $z = 1 x^2 + y^2$
- Use the interval  $x, y \in [-1, 1]$

Yasemin Bekiroglu

# Scripts and functions

- Command windows ok for "calculator type" things
- Many commands ⇒ execute a file with commands instead

Yasemin Bekiroglu

### m-files

- You put your code in so called m-files
- Text file with file-ending .m
- Two types of m-files
  - scripts
  - functions

# Scripts

- Commands listed are executed as if written on command line
- No need to type all commands over and over again
- Easy to reproduce experiments
- A form of documentation of what you did
- Unexpected side effects?
- Ex: All variables cleared, changed, etc. in script also clear, changed in the workspace

Yasemin Bekiroglu

### **Functions**

- Used to "extend functionality" of MATLAB, with syntax: function[out1, out2] = firstfunction(in1, in2)
- The function normally matches filename
- A function can have any number of input (in1, in2) and output (out1, out2) arguments:
- they can be scalar, vectors, matrices, strings, handles, functions, etc.

Yasemin Bekiroglu

# Scripts vs Functions

#### Scripts:

- Define experiment setups
- Operate on base workspace variables
- Solve very specific problem once

#### Functions:

- Easy to reuse functionality
- Solve general problem
- Arbitrary parameters
- Use private variables (do not affect base workspace)

Yasemin Bekiroglu

Output, Input and Commenting

### **Creating/Editing files**

- MATLAB has a built-in text editor
- Create a new file or edit existing file with edit <filename>

Yasemin Bekiroglu

Output, Input and Commenting

# Outputting text

- You often want to output text
- Useful to make user understand what is going on
- disp('Some really nice text')
- NOTE: Strings in MATLAB are in single quotes

Yasemin Bekiroglu

# Getting input from the user

- You can easily get input from user from keyboard
- value = input('Some message that lets the user know what to input: ')
- Input can be empty, scalar, vector, matrix, variable, etc.
- Input will be parsed
- Will repeat question until correct answer is given
- For string input do

s = input('Give us a string: ','s')

Then, input will not be parsed and just returned as string

Output, Input and Commenting

# Adding comments

- Remember that people might want to read you code afterwards!
- You can (and should) add comments:
- Everything on the line after a % is interpreted as a comment

Output, Input and Commenting

### Good variable names

- Besides comments it is good to use meaningful variable names
- On the command line not so important as you are working with it actively
- You might have to understand a script/function after years or from someone else:
  - Not so good

```
a=0:0.1:10;
```

Better

```
speed=0:0.1:10;
```

Even better

```
speed=0:0.1:10; % transl. speed of robot in m/s
```

# Variable scope

- Each function has its own set of variables
  - (normally) functions can not access variables in base/main workspace
  - ▷ variable changes inside function do not affect base workspace
- This helps avoid name clashes (no need to track (all variable names in all functions called)
- These restrictions are called "scoping" and each variable has a "scope"
- Input arguments become local variables inside functions
   changes to input arguments are limited to function

Output, Input and Commenting

### **Exercise 3**

#### Write scripts / functions that

- Ask the reader to click in a window to enter some data
- Display the points in the graph
- Fit a line to them
- Calculate the mean squared error between the points and the line

Lecture 3: Scripts and Functions

Output, Input and Commenting

### Learning by reading

- Remember that there are a lot of m-files in MATLAB
- You can look at all these to learn from
- Either find the file and look at it or do type <function>

Yasemin Bekiroglu

# Adding function description

- You can make sure that others can get useful "help" on your functions
- First comment line in file is used by lookfor

```
Example: function [k,m] =
  calc_lineparameters(x,y)
  % [k,m] = CALC_LINEPARAMETERS(x,y) fits data to
  a line with least squares
  % The resulting parameters describe the line
  on the form
  % y = k*x+m
```

On Customized Help, Paths and Timing

# Working directory

- Check current directory in file system with pwd
- Can change directory with cd <direcory>
- Can check where you are with dir

Yasemin Bekiroglu

# The path

- Similar to OS like windows and Unix/Linux there is a variable that tells where to look for files, the path variable
- Check what your current path is with path
- Add to the path

```
path(path, 'directory')
or
```

addpath <direcory>

- You can also manipulate path with pathtool
- To check which m-file is used when executing a function: which <function>

On Customized Help, Paths and Timing

# What files are run?

- MATLAB cannot tell if an identifier is a variable or a function
- Resolved by picking first match from
  - 1. variable in current workspace
  - 2. built-in variable (like pi, i)
  - 3. built-in m-file
  - 4. m-file in current directory
  - 5. m-file in path

Yasemin Bekiroglu

# Timing your code

- When comparing algorithms execution time becomes important
- Start a stopwatch timer with: tic
- Stop stopwatch timer and get elapsed time with: toc
- An alternative is to look at spent CPU-time cputime
- Used as:

```
start_time = cputime;
...
disp('Spent CPU-time is') cputime-start_time;
```

Lecture 3: Scripts and Functions

On Customized Help, Paths and Timing

### Next time

#### More on programming in MATLAB

Yasemin Bekiroglu

Royal Institute of Technology - KTH

### Presentation 3: How to Speedup Matlab Code

- Find out how to write efficient matlab code, what can be done to improve speed?
- Introduce the Matlab tool Profiler, discuss factors such as array preallocation,
- vectorization provide comparisons of implementations with and without vectorization in terms of running time
- referencing operations (subscripts vs indices, vectorized subscripts, using :, ), bounding a value without if statments, etc.
- show that the performance is improved by providing plots of running times with and without these tricks.

On Customized Help, Paths and Timing

# Presentation 4: Regression and Classification with Matlab

- Introduce regression and classification, what is supervised or unsupervised learning?
- Talk about some standart regression and classification methods: e.g., logistic regression, neural networks, k nearest neighbor classifier, decision trees
- Try matlab toolboxes for the methods that you select on public datasets and discuss the results

Yasemin Bekiroglu

On Customized Help, Paths and Timing

# Presentation 5: Image Processing with Matlab

- Introduce how to process images in Matlab
- Talk about some standart image processing operations: e.g., Color Based Segmentation, histogram equalization
- Try matlab toolboxes (and/or your implementations) for those methods

Yasemin Bekiroglu
