

Online theater ticket booking and administrative system

Kårspexet, the largest student theater group of KTH, would like to have an online system to control the booking of tickets and administration of sales. We have quite a clear picture of what we want but not the time or resources to implement it ourselves.

Software components

The software should consist of three parts:

- A web interface where customers can book and purchase their tickets from home.
- An interface for direct sales where the interface is displayed on a laptop by a salesperson from Kårspexet
- An administrative interface where the ticket administrator can assign seats and verify online payments etc.

All of this will have to be linked to a database.

Finished product and a small bonus...

We want full access to the code when the project is over but we won't claim any ownership of it; you are free to use it afterward as you see fit. Maybe you want to sell it to the other student theater groups at KTH?

And the bonus: All members of the project group will get to see Kårspexet for free!
