Systemprogrammering 2006 Föreläsning 9 Web Services

Topics

- HTTP
- Serving static content
- Serving dynamic content

Web History (cont)

1992

- NCSA server released
- 26 WWW servers worldwide

1993

- Marc Andreessen releases first version of NCSA Mosaic browser
- Mosaic version released for (Windows, Mac, Unix).
- Web (port 80) traffic at 1% of NSFNET backbone traffic.
- Over 200 WWW servers worldwide.

1994

Andreessen and colleagues leave NCSA to form "Mosaic Communications Corp" (now Netscape).

Web History

1945:

- Vannevar Bush, "As we may think", Atlantic Monthly, July, 1945.
 - Describes the idea of a distributed hypertext system.
 - A "memex" that mimics the "web of trails" in our minds.

1989:

- Tim Berners-Lee (CERN) writes internal proposal to develop a distributed hypertext system.
 - Connects "a web of notes with links."
 - Intended to help CERN physicists in large projects share and manage information

1990:

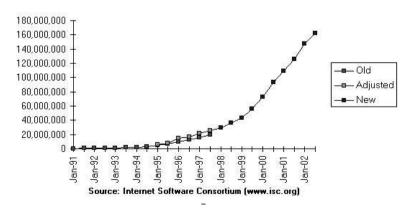

F9 – 4 –

■ Tim BL writes a graphical browser for Next machines.

Internet Hosts

Internet Domain Survey Host Count

Systemprogrammering 2007

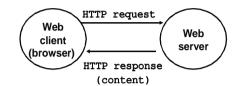

Web Servers

Clients and servers communicate using the **HyperText Transfer Protocol** (HTTP)

- Client and server establish TCP connection
- Client requests content
- Server responds with requested content
- Client and server close connection (usually)

Current version is HTTP/1.1

RFC 2616. June. 1999.

F9-5-Systemprogrammering 2007

Static and Dynamic Content

The content returned in HTTP responses can be either static or dynamic.

- Static content: content stored in files and retrieved in response to an HTTP request
 - Examples: HTML files, images, audio clips.
- Dynamic content: content produced on-the-fly in response to an **HTTP** request
 - Example: content produced by a program executed by the server on behalf of the client.

Bottom line: All Web content is associated with a file that is managed by the server.

Web Content

Web servers return content to clients

content: a sequence of bytes with an associated MIME (Multipurpose **Internet Mail Extensions) type**

Example MIME types

text/html HTML document ■ text/plain Unformatted text

application/postscript Postcript document

■ image/gif Binary image encoded in GIF format

image/ipeg Binary image encoded in JPEG format

F9 - 6 -Systemprogrammering 2007

URLs

Each file managed by a server has a unique name called a URL (Universal Resource Locator)

URLs for static content:

- http://www.cs.cmu.edu:80/index.html
- http://www.cs.cmu.edu/index.html
- http://www.cs.cmu.edu
 - Identifies a file called index.html, managed by a Web server at www.cs.cmu.edu that is listening on port 80.

URLs for dynamic content:

- http://www.cs.cmu.edu:8000/cgi-bin/adder?15000&213
 - Identifies an executable file called adder, managed by a Web server at www.cs.cmu.edu that is listening on port 8000, that should be called with two argument strings: 15000 and 213.

F9 - 7 -Systemprogrammering 2007 F9 - 8 -Systemprogrammering 2007

How Clients and Servers Use URLs

Example URL: http://www.aol.com:80/index.html Clients use prefix (http://www.aol.com:80) to infer:

- What kind of server to contact (Web server)
- Where the server is (www.aol.com)
- What port it is listening on (80)

Servers use suffix (/index.html) to:

- Determine if request is for static or dynamic content.
 - No hard and fast rules for this.
 - Convention: executables reside in cgi-bin directory
- Find file on file system.
 - Initial "/" in suffix denotes home directory for requested content.
 - Minimal suffix is "/", which all servers expand to some default home page (e.g., index.html).

F9 – 9 – Systemprogrammering 2007

HTTP Requests

HTTP request is a request line, followed by zero or more request headers

Request line: <method> <uri> <version>

- <version> is HTTP version of request (HTTP/1.0 or HTTP/1.1)
- <uri>is typically URL for proxies, URL suffix for servers.
- <method> is either GET, POST, OPTIONS, HEAD, PUT,
 DELETE, or TRACE.

Anatomy of an HTTP Transaction

unix> telnet www.aol.com 80 Client: open connection to server
Trying 205.188.146.23... Telnet prints 3 lines to the terminal

Connected to aol.com.
Escape character is '^l'.

GET / HTTP/1.1 Client: request line

host: www.aol.com Client: required HTTP/1.1 HOST header

Client: empty line terminates headers,

HTTP/1.0 200 OK Server: response line

MIME-Version: 1.0 Server: followed by five response headers

Date: Mon, 08 Jan 2001 04:59:42 GMT Server: NaviServer/2.0 AOLserver/2.3.3

Content-Type: text/html Server: expect HTML in the response body

Content-Length: 42092 Server: expect 42,092 bytes in the resp body

Server: empty line (" \r ") terminates hdrs

<html> Server: first HTML line in response body
... Server: 766 lines of HTML not shown.
</html> Server: last HTML line in response body

Connection closed by foreign host. Server: closes connection

unix> Client: closes connection and terminates

F9 – 10 – Systemprogrammering 2007

HTTP Requests (cont)

HTTP methods:

- GET: Retrieve static or dynamic content
 - Arguments for dynamic content are in URI
 - Workhorse method (99% of requests)
- POST: Retrieve dynamic content
 - Arguments for dynamic content are in the request body
- OPTIONS: Get server or file attributes
- HEAD: Like GET but no data in response body
- PUT: Write a file to the server!
- DELETE: Delete a file on the server!
- TRACE: Echo request in response body
 - Useful for debugging.

F9 – 11 – Systemprogrammering 2007 F9 – 12 – Systemprogrammering 2007

HTTP Requests (cont)

Request headers: <header name>: <header data>

Provide additional information to the server.

Major differences between HTTP/1.1 and HTTP/1.0

- HTTP/1.0 uses a new connection for each transaction.
- HTTP/1.1 also supports persistent connections
 - multiple transactions over the same connection. Usefull when requesting pictures for a webb-page.
 - Connection: Keep-Alive
- HTTP/1.1 requires HOST header
 - Host: kittyhawk.cmcl.cs.cmu.edu
- HTTP/1.1 adds additional support for caching

F9 – 13 – Systemprogrammering 2007

GET Request to Apache Server From IE Browser

```
GET /test.html HTTP/1.1
Accept: */*
Accept-Language: en-us
Accept-Encoding: gzip, deflate
User-Agent: Mozilla/4.0 (compatible; MSIE 4.01; Windows 98)
Host: euro.ecom.cmu.edu
Connection: Keep-Alive
CRLF (\r\n)
```

HTTP Responses

HTTP response is a response line followed by zero or more response headers.

Response line:

<version> <status code> <status msg>

- <version> is HTTP version of the response.
- <status code> is numeric status.
- <status msg> is corresponding English text.

200 OK Request was handled without error
 403 Forbidden Server lacks permission to access file

• 404 Not found Server couldn't find the file.

- Provide additional information about response
- Content-Type: MIME type of content in response body.
- Content-Length: Length of content in response body.

F9 – 14 – Systemprogrammering 2007

GET Response From Apache Server

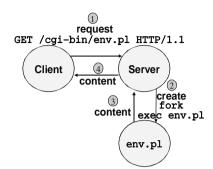

```
HTTP/1.1 200 OK
Date: Thu, 22 Jul 1999 04:02:15 GMT
Server: Apache/1.3.3 Ben-SSL/1.28 (Unix)
Last-Modified: Thu, 22 Jul 1999 03:33:21 GMT
ETag: "48bb2-4f-37969101"
Accept-Ranges: bytes
Content-Length: 79
Keep-Alive: timeout=15, max=100
Connection: Keep-Alive
Content-Type: text/html
CRLF
<html>
<head><title>Test page</title></head>
<body>
<h1>Test page</h1>
</html>
```

F9 – 15 – Systemprogrammering 2007 F9 – 16 – Systemprogrammering 2007

Serving Dynamic Content

- 1 Client sends request to server.
- 2 As the request contains string "/cgi-bin", the server assumes that the request is for dynamic content. The server creates a child process that runs the program identified by the URI.
- 3 The child generates the dynamic content and sends it to the server.
- 4 The server forwards the **content**, without modification, to the client.

F9 - 17 -

Systemprogrammering 2007

CGI

Because the children are written according to the CGI spec, they are often called CGI programs.

Because many CGI programs are written in Perl, they are often called *CGI scripts*.

However, CGI really defines a simple standard for transferring information between the client (browser), the server, and the child process.

Issues in Serving Dynamic Content

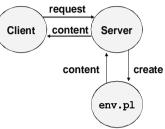

How does the client pass program arguments to the server?

How does the server pass these arguments to the child?

How does the server pass other info relevant to the request to the child?

How does the server capture the content produced by the child?

These issues are addressed by the Common Gateway Interface (CGI) specification.

Systemprogrammering 2007

add.com: THE Internet addition portal!

Ever need to add two numbers together and you just can't find your calculator?

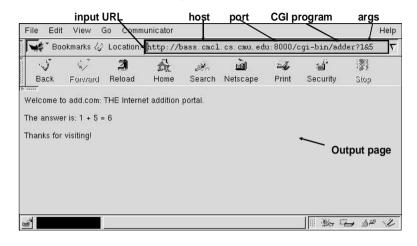

Try Dr. Dave's addition service at "add.com: THE Internet addition portal!"

- Takes as input the two numbers you want to add together.
- Returns their sum in a tasteful personalized message.

After the IPO we'll expand to multiplication!

F9 - 18 -

The add.com Experience

F9 – 21 – Systemprogrammering 2007

Serving Dynamic Content With GET

URL:

■ http://add.com/cgi-bin/adder?1&2

Result displayed on browser:

Welcome to add.com: THE Internet addition portal.

The answer is: 1 + 2 = 3Thanks for visiting! Tell your friends.

F9 – 23 – Systemprogrammering 2007

Serving Dynamic Content With GET

Question: How does the client pass arguments to the server?

Answer: The arguments are appended to the URI

Can be encoded directly in a URL typed to a browser or a

URL in an HTML link

- http://add.com/cgi-bin/adder?1&2
- adder is the CGI program on the server that will do the addition.
- argument list starts with #?"
- arguments separated by #&"
- spaces represented by **+" or ***20"

Can also be generated by an HTML form

<form method=get action="http://add.com/cgi-bin/postadder">

F9 – 22 – Systemprogrammering 2007

Serving Dynamic Content With GET

Question: How does the server pass these arguments to the child?

Answer: In environment variable QUERY_STRING

- A single string containing everything after the "?"
- For add.com: QUERY_STRING = "1&2"

```
/* child code that accesses the argument list */
if ((buf = getenv("QUERY_STRING")) == NULL) {
   exit(1);
}

/* extract arg1 and arg2 from buf and convert */
...
n1 = atoi(arg1);
n2 = atoi(arg2);
```

F9 – 24 – Systemprogrammering 2007

Serving Dynamic Content With GET

Question: How does the server pass other info relevant to the request to the child?

<u>Answer:</u> In a collection of environment variables defined by the CGI spec.

F9 – 25 – Systemprogrammering 2007

Some CGI Environment Variables

In addition, the value of each header of type type received from the client is placed in environment variable HTTP_type

Examples:

F9 - 27 -

- HTTP_ACCEPT
- HTTP_HOST
- HTTP_USER_AGENT (any "-" is changed to "_")

Systemprogrammering 2007

Some CGI Environment Variables

General

- SERVER SOFTWARE
- SERVER_NAME
- GATEWAY_INTERFACE (CGI version)

Request-specific

- SERVER PORT
- REQUEST_METHOD (GET, POST, etc)
- QUERY_STRING (contains GET args)
- REMOTE_HOST (domain name of client)
- REMOTE_ADDR (IP address of client)
- CONTENT_TYPE (for POST, type of data in message body, e.g., text/html)
- CONTENT_LENGTH (length in bytes)

F9 – 26 – Systemprogrammering 2007

Serving Dynamic Content With GET

Question: How does the server capture the content produced by the child?

Answer: The child generates its output on stdout. Server uses dup2 to redirect stdout to its connected socket.

Notice that only the child knows the type and size of the content. Thus the child (not the server) must generate the corresponding headers.

F9 – 28 – Systemprogrammering 2007

Serving Dynamic Content With GET

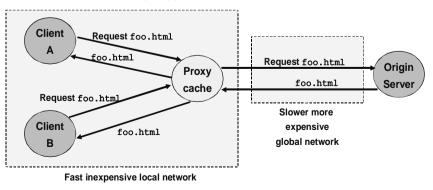

```
bass> ./tiny 8000
                                            HTTP request received by
GET /cgi-bin/adder?1&2 HTTP/1.1
                                            Tinv Web server
Host: bass.cmcl.cs.cmu.edu:8000
kittyhawk> telnet bass 8000
Trying 128.2.222.85...
Connected to BASS.CMCL.CS.CMU.EDU.
Escape character is '^]'.
GET /cgi-bin/adder?1&2 HTTP/1.1
Host: bass.cmcl.cs.cmu.edu:8000
<CRLF>
                                             HTTP request sent by client
HTTP/1.1 200 QK
                                             HTTP response generated by
Server: Tiny Web Server
Content-length: 102
                                             HTTP response generated by
Content-type: text/html
<CRLF>
                                             the CGI program
Welcome to add.com: THE Internet addition portal.
p>The answer is: 1 + 2 = 3
Thanks for visiting!
Connection closed by foreign host.
kittyhawk>
```

F9 – 29 – Systemprogrammering 2007

Why Proxies?

Can perform useful functions as requests and responses pass by

■ Examples: Caching, logging, anonymization

F9 – 31 – Systemprogrammering 2007

Proxies

A proxy is an intermediary between a client and an origin server.

- To the client, the proxy acts like a server.
- To the server, the proxy acts like a client.

F9 – 30 – Systemprogrammering 2007

For More Information

Study the Tiny Web server described in your text

- Tiny is a sequential Web server.
- Serves static and dynamic content to real browsers.
 - text files, HTML files, GIF and JPEG images.
- 220 lines of commented C code.
- Also comes with an implementation of the CGI script for the add.com addition portal.

F9 – 32 – Systemprogrammering 2007
